LARAVEL

“Laravel is a web application framework with expressive, elegant syntax. A web framework provides a structure and starting point for creating your application, allowing you to focus on creating something amazing while we sweat the details.”

# Why Laravel?

## Progressive Framework

Laravel grows with you. Its vast library of documentation, guides, and video tutorials will help you learn the ropes without becoming overwhelmed.

## Scalable Framework

Laravel applications have been easily scaled to handle hundreds of millions of requests per month.

## Community Framework

Laravel combines the best packages in the PHP ecosystem to offer the most robust and developer friendly framework available.

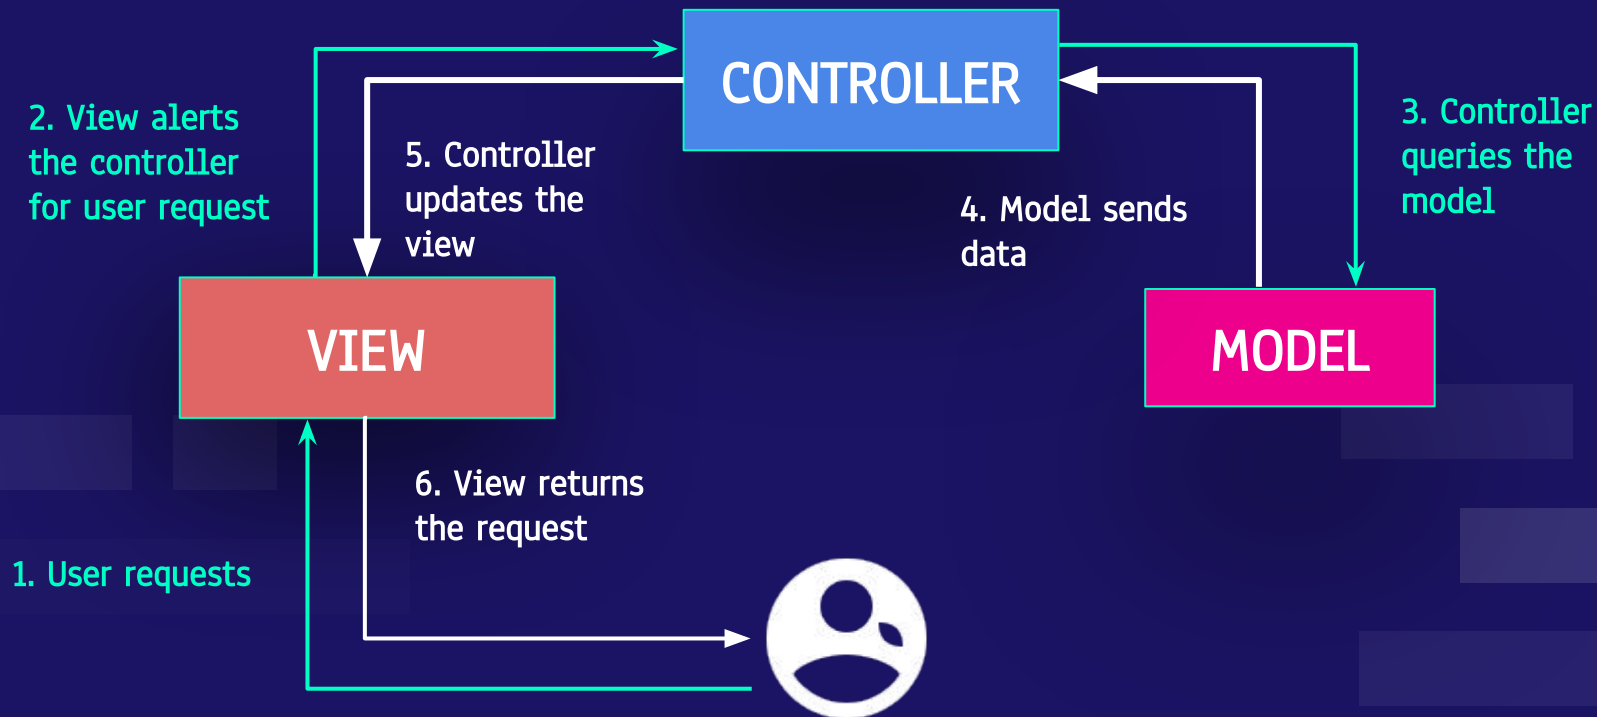

# Features

1. Model-View-Controller (MVC) Architecture
2. Artisan
3. Routing
4. Libraries
5. Database (ORM, Migration)
6. Security
7. Blade Template

# 1. MVC Architecture Support

# Install Laravel

1. `composer create-project laravel/laravel app_name`
2. `cd app-name`
3. `php artisan serve`

*Installation:*

<https://laravel.com/docs/8.x/installation>

## 2. Artisan

Laravel Artisan is a command-line tool that performs repetitive programming tasks that do not allow the PHP developers to perform manually.

### 3. Routing

Routing creates the paths of your site that requires authentication.

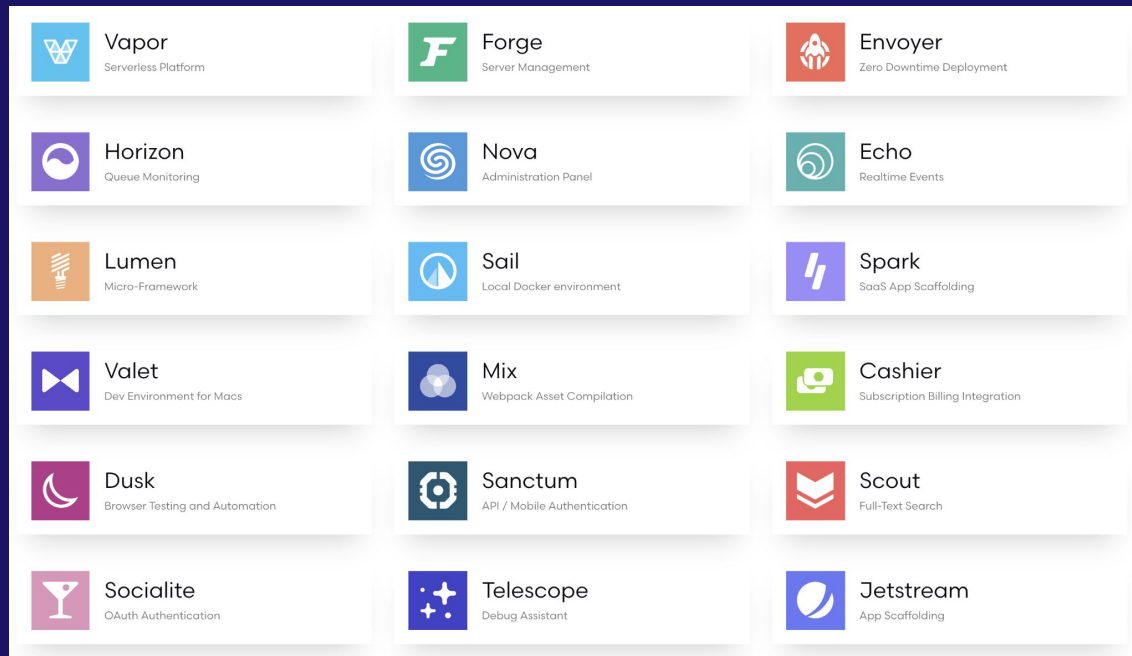

This is used in attaching the Application URLs to the specific controller view or action.

## 4. Libraries/Packages

Laravel is very popular as some Object-oriented libraries, and pre-installed libraries are added to this framework.

The authentication library used for a password reset, monitoring user activities, BCrypt hashing, and CSRF protection.

## 5. Database (ORM, Query Builder)

Laravel makes interacting with databases extremely simple across a variety of supported databases using raw SQL, a fluent query builder, and the Eloquent ORM.

# 5. Security

Application security is one of the most important factors in web application development.

Laravel has an inbuilt web application security.

Authentication

Authorization

Encryption

Email  
Verification

Hashing

Password  
Reset

## 6. Blade Template

Blade is the simple, yet powerful templating engine that is included with Laravel.

Blade templates are compiled into plain PHP code and cached until they are modified, meaning Blade adds essentially zero overhead to your application

```
1  @extends('layouts.app')
2
3  @section('content')
4  <div class="container">
5      <div class="row justify-content-center">
6          <div class="col-md-8">
7              <div class="card">
8                  <div class="card-header">{{ __('Dashboard') }}</div>
9
10                 <div class="card-body">
11                     @if (session('status'))
12                         <div class="alert alert-success" role="alert">
13                             {{ session('status') }}
14                         </div>
15                     @endif
16
17                     {{ __('You are logged in!') }}
18                 </div>
19             </div>
20         </div>
21     </div>
22 </div>
23 @endsection

So, where is  
Vue JS?

03

Vue JS

“Vue (pronounced /vjuː/,  
like view) is a  
progressive  
framework for building  
user interfaces  
”

# Why Vue?

## Approachable

Already know HTML, CSS and JavaScript? Read the guide and start building things in no time!

## Versatile

An incrementally adoptable ecosystem that scales between a library and a full-featured framework.

## Performant

20KB min+gzip Runtime  
Blazing Fast Virtual DOM  
Minimal Optimization Efforts

# Reactive Data Binding

# Directives

Directives are the part of Vue.js that attach special meaning and behavior to plain html elements on the page.

- v-model
- v-on
- v-bind
